Truly Performing

The satisfaction of the customer

is our highest priority.

We know that the efficiency and productivity of our products are important factors to you. Our W. MÜLLER service team supports you in the maintenance of your machines, by offering repair services in difficult situations. Our teams work efficiently with the highest level of professionalism - supported by our spare parts inventories and worldwide shipping capabilities. Our in-house production is your advantage. Even our complex designed parts are available as replacements within a short period of time. Preventive maintenance and service is an important issue for us. We are happy to offer you high-quality service packages for your machinery.

Spare parts

Our extrusion heads are often in use for several decades because we offer flawless service. This applies to our entire range of spare parts, including heating elements, wear parts, servo motors and wall thickness programmers, to only name a few. We can replace appropriate parts without jeopardizing your production process – on site if necessary.

Troubleshooting, process consulting, optimization and training

Extrusion blow molding is an extremely complex and very sensitive process. Knowing the significance and interrelationships of the many influencing variables and controlling them so that production parameters and article quality run together, require a great deal of experience and skill. We are happy to share our experience and knowledge with you, regardless of whether it is an extrusion head from us or another manufacturer.

On-site assembly and commissioning

We offer installation and assembly of new, used, or existing heads on new EBM machines or your existing machines at your facility. Commissioning of the die extrusion head and training of your personnel are included.

We are looking forward to your requests!
